Preface XV

Acknowledgments XIX

List of Important Symbols and Abbreviations XXV

1	Introduction	1
1.1	The Importance of Liquids	1
1.2	Solids, Gases, and Liquids	2
1.3	Outline and Approach	5
1.4	Notation	8
	References	9
	Further Reading	9
2	Basic Macroscopic and Microscopic Concepts: Thermodynamics, Classical, and Quantum Mechanics	11
2.1	Thermodynamics	11
2.1.1	The Four Laws	11
2.1.2	Quasi-Conservative and Dissipative Forces	15
2.1.3	Equation of State	16
2.1.4	Equilibrium	17
2.1.5	Auxiliary Functions	18
2.1.6	Some Derivatives and Their Relationships	20
2.1.7	Chemical Content	21
2.1.8	Chemical Equilibrium	24
2.2	Classical Mechanics	26
2.2.1	Generalized Coordinates	27
2.2.2	Hamilton's Principle and Lagrange's Equations	28
2.2.3	Conservation Laws	30
2.2.4	Hamilton's Equations	33
2.3	Quantum Concepts	35
2.3.1	Basics of Quantum Mechanics	35
2.3.2	The Particle-in-a-Box	41
2.3.3	The Harmonic Oscillator	42
2.3.4	The Rigid Rotator	43

2.4	Approximate Solutions	44
2.4.1	The Born–Oppenheimer Approximation	44
2.4.2	The Variation Principle	45
2.4.3	Perturbation Theory	48
	References	51
	Further Reading	51
3	Basic Energetics: Intermolecular Interactions	53
3.1	Preliminaries	53
3.2	Electrostatic Interaction	55
3.3	Induction Interaction	59
3.4	Dispersion Interaction	60
3.5	The Total Interaction	63
3.6	Model Potentials	65
3.7	Refinements	68
3.7.1	Hydrogen Bonding	68
3.7.2	Three-Body Interactions	70
3.7.3	Accurate Empirical Potentials	70
3.8	The Virial Theorem	72
	References	72
	Further Reading	73
4	Describing Liquids: Phenomenological Behavior	75
4.1	Phase Behavior	75
4.2	Equations of State	76
4.3	Corresponding States	79
4.3.1	Extended Principle	82
	References	86
	Further Reading	87
5	The Transition from Microscopic to Macroscopic: Statistical Thermodynamics	89
5.1	Statistical Thermodynamics	89
5.1.1	Some Concepts	89
5.1.2	Entropy and Partition Functions	91
5.1.3	Fluctuations	99
5.2	Perfect Gases	101
5.2.1	Single Particle	101
5.2.2	Many Particles	102
5.2.3	Pressure and Energy	103
5.3	The Semi-Classical Approximation	104
5.4	A Few General Aspects	110
5.5	Internal Contributions	112
5.5.1	Vibrations	112
5.5.2	Rotations	115
5.5.3	Electronic Transitions	116

5.6	Real Gases	118
5.6.1	Single Particle	118
5.6.2	Interacting Particles	118
5.6.3	The Virial Expansion: Canonical Method	119
5.6.4	The Virial Expansion: Grand Canonical Method	121
5.6.5	Critique and Some Further Remarks	123
	References	126
	Further Reading	127
6	Describing Liquids: Structure and Energetics	129
6.1	The Structure of Solids	129
6.2	The Meaning of Structure for Liquids	132
6.2.1	Distributions Functions	132
6.2.2	Two Asides	136
6.3	The Experimental Determination of $g(r)$	138
6.4	The Structure of Liquids	140
6.5	Energetics	146
6.6	The Potential of Mean Force	150
	References	154
	Further Reading	154
7	Modeling the Structure of Liquids: The Integral Equation Approach	155
7.1	The Vital Role of the Correlation Function	155
7.2	Integral Equations	156
7.2.1	The Yvon–Born–Green Equation	156
7.2.2	The Kirkwood Equation	158
7.2.3	The Ornstein–Zernike Equation	159
7.2.4	The Percus–Yevick Equation	161
7.2.5	The Hyper-Netted Chain Equation	162
7.2.6	The Mean Spherical Approximation	162
7.2.7	Comparison	163
7.3	Hard-Sphere Results	165
7.4	Perturbation Theory	168
7.4.1	The Gibbs–Bogoliubov Inequality	168
7.4.2	The Barker–Henderson Approach	170
7.4.3	The Weeks–Chandler–Andersen Approach	172
7.5	Molecular Fluids	174
7.6	Final Remarks	174
	References	175
	Further Reading	175
8	Modeling the Structure of Liquids: The Physical Model Approach	177
8.1	Preliminaries	177
8.2	Cell Models	178
8.3	Hole Models	187

8.3.1	The Basic Hole Model	189
8.3.2	An Extended Hole Model	191
8.4	Significant Liquid Structures	194
8.5	Scaled-Particle Theory	200
	References	202
	Further Reading	202
9	Modeling the Structure of Liquids: The Simulation Approach	203
9.1	Preliminaries	203
9.2	Molecular Dynamics	205
9.3	The Monte Carlo Method	211
9.4	An Example: Ammonia	214
	References	218
	Further Reading	219
10	Describing the Behavior of Liquids: Polar Liquids	221
10.1	Basic Aspects	221
10.2	Towards a Microscopic Interpretation	223
10.3	Dielectric Behavior of Gases	224
10.3.1	Estimating μ and α	229
10.4	Dielectric Behavior of Liquids	231
10.5	Water	238
10.5.1	Models of Water	241
10.5.2	The Structure of Liquid Water	242
10.5.3	Properties of Water	245
	References	249
	Further Reading	250
11	Mixing Liquids: Molecular Solutions	251
11.1	Basic Aspects	251
11.1.1	Partial and Molar Quantities	251
11.1.2	Perfect Solutions	253
11.2	Ideal and Real Solutions	256
11.2.1	Raoult's and Henry's Laws	257
11.2.2	Deviations	258
11.3	Colligative Properties	260
11.4	Ideal Behavior in Statistical Terms	262
11.5	The Regular Solution Model	265
11.5.1	The Activity Coefficient	267
11.5.2	Phase Separation and Vapor Pressure	268
11.5.3	The Nature of w and Beyond	270
11.6	A Slightly Different Approach	272
11.6.1	The Solubility Parameter Approach	274
11.6.2	The One- and Two-Fluid Model	275
11.7	The Activity Coefficient for Other Composition Measures	277

11.8	Empirical Improvements	278
11.9	Theoretical Improvements	281
	References	283
	Further Reading	284
12	Mixing Liquids: Ionic Solutions	285
12.1	Ions in Solution	285
12.1.1	Solubility	286
12.2	The Born Model and Some Extensions	289
12.3	Hydration Structure	293
12.3.1	Gas-Phase Hydration	293
12.3.2	Liquid-Phase Hydration	294
12.4	Strong and Weak Electrolytes	300
12.5	Debye–Hückel Theory	303
12.5.1	The Activity Coefficient and the Limiting Law	306
12.5.2	Extensions	307
12.6	Structure and Thermodynamics	308
12.6.1	The Correlation Function and Screening	308
12.6.2	Thermodynamic Potentials	310
12.7	Conductivity	311
12.7.1	Mobility and Diffusion	315
12.8	Conductivity Continued	317
12.8.1	Association	320
12.9	Final Remarks	323
	References	323
	Further Reading	324
13	Mixing Liquids: Polymeric Solutions	325
13.1	Polymer Configurations	325
13.2	Real Chains in Solution	333
13.2.1	Temperature Effects	337
13.3	The Florry–Huggins Model	339
13.3.1	The Entropy	339
13.3.2	The Energy	342
13.3.3	The Helmholtz Energy	343
13.3.4	Phase Behavior	344
13.4	Solubility Theory	347
13.5	EoS Theories	352
13.5.1	A Simple Cell Model	352
13.5.2	The FOVE Theory	354
13.5.3	The LF Theory	356
13.5.4	The SS Theory	358
13.6	The SAFT Approach	361
	References	368
	Further Reading	369

14	Some Special Topics: Reactions in Solutions	371
14.1	Kinetics Basics	371
14.2	Transition State Theory	373
14.2.1	The Equilibrium Constant	373
14.2.2	Potential Energy Surfaces	374
14.2.3	The Activated Complex	376
14.3	Solvent Effects	379
14.4	Diffusion Control	381
14.5	Reaction Control	384
14.6	Neutral Molecules	385
14.7	Ionic Solutions	387
14.7.1	The Double-Sphere Model	388
14.7.2	The Single-Sphere Model	389
14.7.3	Influence of Ionic Strength	390
14.7.4	Influence of Permittivity	392
14.8	Final Remarks	392
	References	393
	Further Reading	393
15	Some Special Topics: Surfaces of Liquids and Solutions	395
15.1	Thermodynamics of Surfaces	395
15.2	One-Component Liquid Surfaces	402
15.3	Gradient Theory	409
15.4	Two-Component Liquid Surfaces	413
15.5	Statistics of Adsorption	415
15.6	Characteristic Adsorption Behavior	417
15.6.1	Amphiphilic Solutes	418
15.6.2	Hydrophobic Solutes	423
15.6.3	Hydrophilic Solutes	424
15.7	Final Remarks	425
	References	425
	Further Reading	427
16	Some Special Topics: Phase Transitions	429
16.1	Some General Considerations	429
16.2	Discontinuous Transitions	434
16.2.1	Evaporation	435
16.2.2	Melting	437
16.3	Continuous Transitions and the Critical Point	437
16.3.1	Limiting Behavior	438
16.3.2	Mean Field Theory: Continuous Transitions	441
16.3.3	Mean Field Theory: Discontinuous Transitions	444
16.3.4	Mean Field Theory: Fluid Transitions	444
16.4	Scaling	447
16.4.1	Homogeneous Functions	447

16.4.2	Scaled Potentials	448
16.4.3	Scaling Lattices	449
16.5	Renormalization	451
16.6	Final Remarks	457
	References	457
	Further Reading	458

Appendix A Units, Physical Constants, and Conversion Factors 459

Basic and Derived SI Units	459
Physical Constants	460
Conversion Factors for Non-SI Units	460
Prefixes	460
Greek Alphabet	461
Standard Values	461

Appendix B Some Useful Mathematics 463

B.1	Symbols and Conventions	463
B.2	Partial Derivatives	463
B.3	Composite, Implicit, and Homogeneous Functions	465
B.4	Extremes and Lagrange Multipliers	467
B.5	Legendre Transforms	468
B.6	Matrices and Determinants	469
B.7	Change of Variables	471
B.8	Scalars, Vectors, and Tensors	473
B.9	Tensor Analysis	477
B.10	Calculus of Variations	480
B.11	Gamma Function	481
B.12	Dirac and Heaviside Function	482
B.13	Laplace and Fourier Transforms	482
B.14	Some Useful Integrals and Expansions	484
	Further Reading	486

Appendix C The Lattice Gas Model 487

C.1	The Lattice Gas Model	487
C.2	The Zeroth Approximation or Mean Field Solution	488
C.3	The First Approximation or Quasi-Chemical Solution	490
C.3.1	Pair Distributions	491
C.3.2	The Helmholtz Energy	492
C.3.3	Critical Mixing	493
C.4	Final Remarks	494
	References	494

Appendix D Elements of Electrostatics 495

D.1	Coulomb, Gauss, Poisson, and Laplace	495
D.2	A Dielectric Sphere in a Dielectric Matrix	498

XIV | Contents

D.3 A Dipole in a Spherical Cavity 500
Further Reading 501

Appendix E Data 503
References 512

Appendix F Numerical Answers to Selected Problems 513

Index 515 -
