Zusammenfassung	vii
Abstract	ix
List of Abbreviations and Symbols	xi
1. Introduction	1
1.1. Motivation	1
1.1.1. Modeling Soil Using Discrete Elements	3
1.1.2. Penalty-based vs. Nonsmooth Formulations	5
1.2. State of the Art	9
1.3. Aim and Scope	12
1.4. Outline	13
2. Mathematical Preliminaries	15
2.1. Notation	15
2.2. Relevant Function Spaces	17
2.2.1. Absolutely Continuous Functions	18
2.2.2. Functions of Bounded Variation	20
2.2.3. Lebesgue–Stieltjes Measures	23
2.3. Cones and Generalized Inequalities	28
2.4. Jordan Algebras and Symmetric Cones	32
3. Nonsmooth Dynamical Systems	37
3.1. Rigid Body Dynamics	38
3.1.1. The Model of a Rigid Body	38
3.1.2. Euler–Lagrange Equations	41
3.2. Dynamics of a Rigid Body System	46
3.2.1. On Hamilton’s Principle at the Presence of Inequalities	47
3.2.2. Equations of Motion for a Rigid Body System	51
4. Overview of Numerical Methods	55
4.1. Time Discretization	56
4.1.1. A Petrov–Galerkin Representation	57
4.1.2. SHAKE and RATTLE	62
4.1.3. One Time Step of a Simulation	64

4.2.	Contact Models	69
4.2.1.	Unilateral Contact	70
4.2.2.	Coulomb Friction	76
4.3.	On Solving the CCP	87
4.3.1.	Local Solution Strategies	90
4.3.2.	Global Solution Strategies	93
5.	A Conical Interior Point Method	97
5.1.	The Potential Function	98
5.2.	The Central Path	104
5.3.	A Feasible Starting Point	105
5.4.	Maximum Step Length	108
5.5.	Nesterov–Todd Scaling	110
5.6.	Inexact Search Directions	113
5.6.1.	Regularization	115
5.6.2.	Eigenvalues of the Regularized Linear Systems	116
5.6.3.	Preconditioning	119
5.6.4.	Matrix-free Implementation	120
6.	Discussion	125
6.1.	Numerical Tests	125
6.1.1.	Tuning the IPM	125
6.1.2.	Comparison to PGJ	135
6.1.3.	Solving an Industrial Size Problem	137
6.2.	Summary	142
6.3.	Conclusion	145
Appendix		149
A.	Quaternions and Rotation	151
Bibliography		155
