Preface — IX

Notation — XXI

1 Preliminaries — 1

- 1.1 Fundamentals in the theory of Banach spaces — 1
 - 1.1.1 Linear operators and functionals — 1
 - 1.1.2 The dual X^* — 5
 - 1.1.3 The bidual X^{**} — 6
 - 1.1.4 Different choices of topology on a Banach space: strong and weak topologies — 8
 - 1.1.5 The strong topology on X — 9
 - 1.1.6 The weak* topology on X^* — 10
 - 1.1.7 The weak topology on X — 14
- 1.2 Convex subsets of Banach spaces and their properties — 22
 - 1.2.1 Definitions and elementary properties — 22
 - 1.2.2 Separation of convex sets and its consequences — 24
- 1.3 Compact operators and completely continuous operators — 28
- 1.4 Lebesgue spaces — 33
- 1.5 Sobolev spaces — 39
- 1.6 Lebesgue–Bochner and Sobolev–Bochner spaces — 48
- 1.7 Multivalued maps — 52
 - 1.7.1 Michael's selection theorem — 55
- 1.8 Appendix — 57
 - 1.8.1 The finite intersection property — 57
 - 1.8.2 Spaces of continuous functions and the Arzelà–Ascoli theorem — 57
 - 1.8.3 Partitions of unity — 58
 - 1.8.4 Hölder continuous functions — 58
 - 1.8.5 Lebesgue points — 59

2 Differentiability, convexity and optimization in Banach spaces — 61

- 2.1 Differentiability in Banach spaces — 61
 - 2.1.1 The directional derivative — 61
 - 2.1.2 The Gâteaux derivative — 61
 - 2.1.3 The Fréchet derivative — 64
 - 2.1.4 C^1 functionals — 66
 - 2.1.5 Connections between Gâteaux, Fréchet differentiability and continuity — 67
 - 2.1.6 Vector valued maps and higher order derivatives — 69
- 2.2 General results on optimization problems — 71

2.3	Convex functions —	75
2.3.1	Basic definitions, properties and examples —	76
2.3.2	Three important examples: the indicator, Minkowski and support functions —	79
2.3.3	Convexity and semicontinuity —	80
2.3.4	Convexity and continuity —	83
2.3.5	Convexity and differentiability —	83
2.4	Optimization and convexity —	87
2.5	Projections in Hilbert spaces —	89
2.6	Geometric properties of Banach spaces related to convexity —	92
2.6.1	Strictly, uniformly and locally uniformly convex Banach spaces —	92
2.6.2	Convexity and the duality map —	97
2.7	Appendix —	101
2.7.1	Proof of Proposition 2.3.20 —	101
2.7.2	Proof of Proposition 2.3.21 —	102
3	Fixed-point theorems and their applications —	105
3.1	Banach fixed-point theorem —	105
3.1.1	The Banach fixed-point theorem and generalizations —	105
3.1.2	Solvability of differential equations —	107
3.1.3	Nonlinear integral equations —	108
3.1.4	The inverse and the implicit function theorems —	109
3.1.5	Iterative schemes for the solution of operator equations —	114
3.2	The Brouwer fixed-point theorem and its consequences —	116
3.2.1	Some topological notions —	116
3.2.2	Various forms of the Brouwer fixed-point theorem —	117
3.2.3	Brouwer's theorem and surjectivity of coercive maps —	119
3.2.4	Application of Brouwer's theorem in mathematical economics —	120
3.2.5	Failure of Brouwer's theorem in infinite dimensions —	122
3.3	Schauder fixed-point theorem and Leray–Schauder alternative —	123
3.3.1	Schauder fixed-point theorem —	124
3.3.2	Application of Schauder fixed-point theorem to the solvability of nonlinear integral equations —	125
3.3.3	The Leray–Schauder principle —	127
3.3.4	Application of the Leray–Schauder alternative to nonlinear integral equations —	128
3.4	Fixed-point theorems for nonexpansive maps —	130
3.4.1	The Browder fixed-point theorem —	131
3.4.2	The Krasnoselskii–Mann algorithm —	134
3.5	A fixed-point theorem for multivalued maps —	138
3.6	The Ekeland variational principle and Caristi's fixed-point theorem —	140

3.6.1	The Ekeland variational principle — 141
3.6.2	Caristi's fixed-point theorem — 143
3.6.3	Applications: approximation of critical points — 144
3.7	Appendix — 145
3.7.1	The Gronwall inequality — 145
3.7.2	Composition of averaged operators — 145
4	Nonsmooth analysis: the subdifferential — 147
4.1	The subdifferential: definition and examples — 147
4.2	The subdifferential for convex functions — 151
4.2.1	Existence and fundamental properties — 151
4.2.2	The subdifferential and the right-hand side directional derivative — 154
4.3	Subdifferential calculus — 157
4.4	The subdifferential and the duality map — 162
4.5	Approximation of the subdifferential and density of its domain — 166
4.6	The subdifferential and optimization — 168
4.7	The Moreau proximity operator in Hilbert spaces — 170
4.7.1	Definition and fundamental properties — 170
4.7.2	The Moreau–Yosida approximation — 174
4.8	The proximity operator and numerical optimization algorithms — 177
4.8.1	The standard proximal method — 178
4.8.2	The forward-backward and the Douglas–Rachford scheme — 184
5	Minimax theorems and duality — 191
5.1	A minimax theorem — 191
5.2	Conjugate functions — 196
5.2.1	The Legendre–Fenchel conjugate — 196
5.2.2	The biconjugate function — 200
5.2.3	The subdifferential and the Legendre–Fenchel transform — 204
5.3	The inf-convolution — 207
5.4	Duality and optimization: Fenchel duality — 212
5.5	Minimax and convex duality methods — 222
5.5.1	A general framework — 223
5.5.2	Applications and examples — 231
5.6	Primal dual algorithms — 235
5.7	Appendix — 243
5.7.1	Proof of Proposition 5.1.2 — 243
5.7.2	Proof of Lemma 5.5.1 — 245
5.7.3	Proof of relation (5.61) — 247
6	The calculus of variations — 249

6.1	Motivation — 249
6.2	Warm up: variational theory of the Laplacian — 251
6.2.1	The Dirichlet functional and the Poisson equation — 252
6.2.2	Regularity properties for the solutions of Poisson-type equations — 257
6.2.3	Laplacian eigenvalue problems — 261
6.3	Semicontinuity of integral functionals — 268
6.3.1	Semicontinuity in Lebesgue spaces — 269
6.3.2	Semicontinuity in Sobolev spaces — 273
6.4	A general problem from the calculus of variations — 274
6.5	Differentiable functionals and connection with nonlinear PDEs: the Euler–Lagrange equation — 276
6.6	Regularity results in the calculus of variations — 279
6.6.1	The De Giorgi class — 281
6.6.2	Hölder continuity of minimizers — 284
6.6.3	Further regularity — 288
6.7	A semilinear elliptic problem and its variational formulation — 294
6.7.1	The case where sub and supersolutions exist — 295
6.7.2	Growth conditions on the nonlinearity — 300
6.7.3	Regularity for semilinear problems — 306
6.8	A variational formulation of the p -Laplacian — 307
6.8.1	The p -Laplacian Poisson equation — 307
6.8.2	A quasilinear nonlinear elliptic equation involving the p -Laplacian — 309
6.9	Appendix — 314
6.9.1	A version of the Riemann–Lebesgue lemma — 314
6.9.2	Proof of Theorem 6.6.3 — 315
6.9.3	Proof of Theorem 6.6.5 — 327
6.9.4	Proof of generalized Caccioppoli estimates — 332
7	Variational inequalities — 335
7.1	Motivation — 335
7.2	Warm up: free boundary value problems for the Laplacian — 336
7.3	The Lax–Milgram–Stampacchia theory — 341
7.4	Variational inequalities of the second kind — 348
7.5	Approximation methods and numerical techniques — 351
7.5.1	The penalization method — 351
7.5.2	Internal approximation schemes — 356
7.6	Application: boundary and free boundary value problems — 359
7.6.1	An important class of bilinear forms — 359
7.6.2	Boundary value problems — 362
7.6.3	Free boundary value problems — 369

7.6.4	Semilinear variational inequalities — 376
7.7	Appendix — 378
7.7.1	An elementary lemma — 378
8	Critical point theory — 379
8.1	Motivation — 379
8.2	The mountain pass and the saddle point theorems — 380
8.2.1	The mountain pass theorem — 380
8.2.2	Generalizations of the mountain pass theorem — 381
8.2.3	The saddle point theorem — 384
8.3	Applications in semilinear elliptic problems — 385
8.3.1	Superlinear growth at infinity — 386
8.3.2	Nonresonant semilinear problems with asymptotic linear growth at infinity and the saddle point theorem — 390
8.3.3	Resonant semilinear problems and the saddle point theorem — 394
8.4	Applications in quasilinear elliptic problems — 399
8.4.1	The p -Laplacian and the mountain pass theorem — 399
8.4.2	Resonant problems for the p -Laplacian and the saddle point theorem — 404
9	Monotone-type operators — 409
9.1	Motivation — 409
9.2	Monotone operators — 410
9.2.1	Monotone operators, definitions and examples — 410
9.2.2	Local boundedness of monotone operators — 411
9.2.3	Hemicontinuity and demicontinuity — 413
9.2.4	Surjectivity of monotone operators and the Minty–Browder theory — 414
9.3	Maximal monotone operators — 417
9.3.1	Maximal monotone operators definitions and examples — 417
9.3.2	Properties of maximal monotone operators — 418
9.3.3	Criteria for maximal monotonicity — 421
9.3.4	Surjectivity results — 422
9.3.5	Maximal monotonicity of the subdifferential and the duality map — 427
9.3.6	Yosida approximation and applications — 429
9.3.7	Sum of maximal monotone operators — 439
9.4	Pseudomonotone operators — 442
9.4.1	Pseudomonotone operators, definitions and examples — 442
9.4.2	Surjectivity results for pseudomonotone operators — 444
9.5	Applications of monotone-type operators — 446
9.5.1	Quasilinear elliptic equations — 446

9.5.2	Semilinear elliptic inclusions —	448
9.5.3	Variational inequalities with monotone-type operators —	450
9.5.4	Gradient flows in Hilbert spaces —	451
9.5.5	The Cauchy problem in evolution triples —	455

Bibliography —	463
