Contributions	iii
Abstract	v
Kurze Zusammenfassung	vii
Zusammenfassung	ix
1 Introduction	1
1.1 Outline	5
2 Biological and theoretical background	7
2.1 Mammalian visual systems	8
2.1.1 The visual pathway	8
2.1.2 Cortical maps	8
2.1.3 Recurrent connectivity in V1	12
2.1.3.1 Short-range recurrent connectivity in species with smooth orientation preference maps	12
2.1.3.2 Long-range recurrent connectivity in species with smooth orientation preference maps	13
2.1.3.3 Recurrent connectivity in species with salt-and-pepper orientation preference arrangements	14
2.2 Neuronal networks	15
2.2.1 Models of a neuron	16
2.2.1.1 Spiking neuron models	16
2.2.1.2 Firing rate model	17
2.2.2 Models of a network	18
2.3 Modeling the mechanisms of orientation selectivity in visual cortex	19
2.3.1 Feed-forward origin of orientation selectivity	19
2.3.2 Orientation selectivity models incorporating recurrent interactions	20
2.3.3 Emergence of smooth orientation preference layouts	21
2.4 Angle estimation and discrimination	22
2.4.1 Psychophysical and behavioral studies on visual perception of ori- entations	23

2.4.2	Angle estimation and discrimination from neural population responses	23
2.5	Outlook	25
3	Model and methods	27
3.1	Model description	28
3.1.1	Feed forward connectivity	29
3.1.1.1	Dependence of input amplitude on the feed-forward tuning	32
3.1.1.2	Random input component	32
3.1.1.3	Orientation preference	34
3.1.1.4	Region of interest	36
3.1.2	Recurrent connectivity	37
3.1.2.1	Distance-dependent lateral connections	37
3.1.2.2	Angle-dependent lateral connections	38
3.1.2.3	Normalization of connectivity matrices	38
3.1.2.4	Strength of recurrent connections	38
3.1.2.5	Activity regimes	38
3.1.2.6	Dependence of activity regimes on the orientation preference layout	40
3.1.3	Summary of model parameters	41
3.2	Angle discrimination and estimation	41
3.2.1	Dataset generation	42
3.2.2	Angle discrimination using Logistic Regression algorithm	42
3.2.2.1	Training the classification model	43
3.2.2.2	Cross-validation procedure	43
3.2.2.3	Choice of angle difference	44
3.2.3	Angle estimation	45
3.3	Network response properties	45
3.3.1	Selectivity	46
3.3.2	Sparsity	46
3.3.3	Signal-to-noise ratio	47
3.3.4	Trial-to-trial variability	47
3.3.5	Response modulation	48
3.4	Numerical simulations	49
4	The role of feed-forward tuning on angle discrimination	51
4.1	Orientation tuning of feed-forward inputs disentangles neural representations	52
4.2	Orientation tuning of feed-forward inputs improves angle discrimination	54
4.2.1	The influence of input tuning on angle discrimination in networks with fixed variance of the input noise	54
4.2.2	The influence of input tuning on angle discrimination in networks with fixed $\text{SNR}_{\text{input}}$	55
4.3	Effect of orientation tuning on selectivity, sparsity and variability of neural responses	57
4.4	Effect of non-uniform distribution of orientation preference on angle estimation	61
4.5	Summary	61

5	The role of recurrent interactions on angle discrimination	63
5.1	The effect of recurrent inhibition and excitation in networks with strong feed-forward tuning	64
5.1.1	Effect of different recurrent connectivities on neural responses . . .	65
5.1.2	Angle discrimination	69
5.1.3	Relationship between angle estimation and discrimination accuracy and neural response properties	72
5.1.3.1	Selectivity, sparsity and angle reconstruction quality . . .	72
5.1.3.2	Variability of the population responses	75
5.1.3.3	Response modulation	78
5.1.3.4	Relation between average selectivity, population sparsity and angle estimation and discrimination quality	81
5.1.4	Conclusion	82
5.2	Mexican hat recurrence connectivity in networks with weakly tuned input	83
5.2.1	Influence of input tuning and recurrent connections on population responses	83
5.2.2	Angle discrimination in recurrent networks with Mexican hat connectivity and different levels of input tuning	84
5.2.3	Relation between discrimination accuracy and neural selectivity . .	85
5.3	Effect of recurrent connections on angle discrimination for different noise levels	88
5.4	Phase randomization	91
5.5	Summary	93
6	The role of orientation preference layout on angle discrimination	97
6.1	Feed-forward models	98
6.1.1	Dependence of angle estimation and discrimination accuracy, selectivity and sparsity on input tuning in networks with OPM and S&P layouts	99
6.1.2	Phase randomization	100
6.2	Recurrent models	102
6.2.1	Mexican hat shaped lateral connections	102
6.2.1.1	Effect of the orientation preference layout on angle discrimination accuracy	102
6.2.1.2	Effect of different map layouts on the effective recurrent connectivity and on the response properties for Mexican hat model	102
6.2.2	Angle-dependent lateral connections	108
6.3	Conclusions	113
7	Discussion	117
	List of Figures	127
	Bibliography	131
	Acknowledgements	147
