

Introduction to Computational Micromechanics

Tarek I. Zohdi
Peter Wriggers

 Springer

Contents

1	Introduction	1
1.1	Basic concepts in micro-macro modeling	3
1.2	Historical overview	4
1.3	Objectives of this monograph	6
2	Some basics in the mechanics of solid continua	7
2.1	Kinematics of deformations	8
2.1.1	Deformation of line elements	9
2.1.2	Infinitesimal strain measures	10
2.1.3	The Jacobian of the Deformation Gradient	10
2.2	Equilibrium/kinetics of solid continua	11
2.2.1	Postulates on volume and surface quantities	12
2.2.2	Balance law formulations	13
2.3	Referential descriptions of balance laws	14
2.4	The First Law of Thermodynamics/An energy balance	16
2.5	The Second Law of Thermodynamics/A restriction	17
2.6	Linear elastic constitutive equations	18
2.6.1	The infinitesimal strain case	20
2.6.2	Material symmetry	21
2.6.3	Material constant interpretation	26
2.6.4	Consequences of positive-definiteness	28
2.7	Hyperelastic finite strain material laws	29
2.7.1	Basic requirements for large strain laws	30
2.7.2	Determination of material constants	31
2.8	Moderate strain constitutive relations	33
3	Fundamental weak formulations	37
3.1	Direct weak formulations	37
3.1.1	An example	39
3.1.2	Some restrictions	39
3.1.3	The Principle of Minimum Potential Energy	40

3.1.4	Complementary weak forms	42
4	Fundamental micro-macro concepts	45
4.1	Testing procedures	46
4.1.1	The Average Strain Theorem	47
4.1.2	The Average Stress Theorem	48
4.1.3	Satisfaction of Hill's energy condition	49
4.2	The Hill-Reuss-Voigt bounds	49
4.3	Observations	51
4.4	Classical micro-macro mechanical approximations	52
4.4.1	The asymptotic Hashin-Shtrikman bounds	52
4.4.2	The concentration tensor: microfield behavior	53
4.4.3	The Eshelby result	54
4.4.4	Dilute methods	55
4.4.5	The Mori-Tanaka method	56
4.4.6	Further methods	57
4.5	Micro-geometrical manufacturing idealizations	59
4.5.1	Upper and lower variational bounds	59
4.5.2	Proof of energetic ordering	60
4.5.3	Uses to approximate the effective property	62
5	A basic finite element implementation	63
5.1	Finite element method implementation	63
5.2	FEM approximation	64
5.3	Global/local transformations	65
5.4	Differential properties of shape functions	67
5.5	Differentiation in the referential coordinates	69
5.6	Post processing	71
5.7	Accuracy of the finite element method	71
5.8	Local adaptive mesh refinement	73
5.8.1	A-Posteriori Recovery Methods	73
5.8.2	A-Posteriori Residual Methods	74
5.9	Solution of finite element equations	75
5.9.1	Krylov searches and minimum principles	76
5.9.2	The Method of Steepest Descent	77
5.9.3	The Conjugate Gradient Method	78
5.9.4	Accelerating computations	79
5.10	Exterior and interior augmentations	80
6	Computational/statistical testing methods	81
6.1	A boundary value formulation	81
6.2	Numerical discretization	82
6.2.1	Topological resolution	83
6.3	Elementally averaged quantities	85
6.4	Iterative Krylov solvers/microstructural "correctors"	87

6.5	Overall testing process: numerical examples	89
6.5.1	Successive sample enlargement	89
6.5.2	Multiple sample tests	91
6.6	A minimum principle interpretation	92
6.6.1	A proof based on partitioning results	93
6.6.2	Relation to the material tests	94
6.7	Dependency on volume fraction	95
6.8	Increasing the number of samples	96
6.9	Increasing sample size	97
7	Various extensions and further interpretations of partitioning	103
7.1	Partitioning and traction test cases	103
7.2	An ergodic interpretation of the results	106
7.3	Statistical shifting theorems	107
7.4	Domain decomposition and ensemble averaging	108
7.4.1	Primal partitioning	108
7.4.2	Complementary partitioning	110
7.4.3	Homogenized material orderings	111
7.4.4	Embedded orthogonal monotonicities	111
7.5	Moment bounds on population responses	112
7.5.1	First order (average) bounds	113
7.5.2	Second order (standard deviation) bounds	113
7.5.3	Third order (skewness) bounds	114
7.6	Remarks	115
8	Domain decomposition analogies and extensions	117
8.1	Boundary value problem formulations	117
8.2	Error in the “broken” problems	119
8.2.1	Multiscale proximity bounds	121
8.2.2	Uses of the bounds for domain decomposition	125
8.3	The connection to material testing	126
8.4	A “total” orthogonal sum	130
8.5	Iterative extensions	131
8.5.1	Method I: global/local CG iterations	132
8.5.2	Method II: iterative equilibration	133
9	Nonconvex-nonerivative genetic material design	141
9.1	Computational material design	142
9.2	Characteristic of such objectives	143
9.2.1	Nonconvexity	143
9.2.2	Size effects	144
9.3	Introduction of constraints	146
9.4	Related fatigue constraints for micoheterogeneous solids	148
9.4.1	Classical fatigue relations	149

9.4.2	Construction of a constraint	149
9.4.3	Qualitative behavior of the fatigue constraints	150
9.5	Nonconvex-nonderivative genetic search	151
9.6	Numerical examples	153
9.7	Scope of use	157
10	Modeling coupled multifield processes	159
10.1	Introduction	159
10.2	A model problem involving multifield processes in multiphase solids	160
10.3	Constitutive assumptions	161
10.3.1	An energy balance including growth	162
10.3.2	Mass transfer and reaction-diffusion models	165
10.4	Staggered multifield weak formulations	166
10.4.1	A recursive algorithm	167
10.4.2	Convergence and contraction-mapping time stepping control	170
10.5	Numerical Experiments	172
10.6	Concluding remarks	176
11	Closing comments	181
