Glossary	ix
1. Introduction	1
1.1. Background and motivation	1
1.2. Research objective and dissertation outline	2
2. Theoretical preliminaries for psychoacoustics, structural acoustics and acoustic control	5
2.1. Basics of psychoacoustics	5
2.1.1. Human hearing characteristics	5
2.1.2. Psychoacoustic and other metrics	8
2.1.3. Just noticeable differences of psychoacoustic metrics	13
2.1.4. Other methods of psychoacoustic evaluation	14
2.2. Vibro-acoustic excitation concepts	15
2.2.1. Forced vibration by a point-force	16
2.2.2. Excitation by an acoustic monopole	17
2.2.3. Excitation by a diffuse sound field	18
2.3. Sound radiation from vibroacoustically excited structures	18
2.3.1. Radiation from plates into free field	19
2.3.2. Radiation from plates into cavities	20
2.4. Active structural acoustic control	22
2.4.1. Optimal actuator placement	23
2.4.2. Radiation filter formulation	25
2.5. Summarising discussion	26
3. Case study: Psychoacoustics of aircraft interior noise	27
3.1. Characterisation of aircraft interior noise and suitability of psychoacoustical quantities	27
3.2. Analysis of in-flight recordings	28
3.3. Summarising discussion	32
4. State of science and research hypotheses	33
4.1. State of science	33
4.1.1. Active noise reduction and psychoacoustics	33
4.1.2. Psychomechanics	37
4.2. Formulation of the hypotheses	38
5. Psychoacoustically motivated actuator placement in ASAC systems	41
5.1. Numerical modelling methods	41
5.1.1. Numerical modelling of the vibro- and psychoacoustic response of a plate	41

5.1.2. The ASAC pre-design method	45
5.2. Numerical investigations for active structural psychoacoustic control	47
5.2.1. Dependence of sound characteristics on distance	47
5.2.2. Effect of point force excitation position on radiation	49
5.2.3. Optimisation of the actuator placement in an ASAC system using a loudness criterion: different excitations	55
5.2.4. Optimisation of the actuator placement in an ASAC system using a loudness criterion: diffuse field excitation	64
5.3. Summarising discussion	72
6. Experimental study on ASAC taking psychoacoustics into account	73
6.1. Experimental model-based ASAC design	73
6.1.1. System identification	73
6.1.2. Radiation filter using radiation modal expansion	75
6.1.3. Optimal feedforward control	76
6.2. The experimental setup	78
6.3. Experimental results	80
6.3.1. Verification of state-space model representation	80
6.3.2. Verification of radiated sound power	81
6.3.3. Results of feedforward ASAC	83
6.4. Summarising discussion	88
7. Conclusions	89
7.1. Status of findings regarding the consideration of psychoacoustic quantities in ASAC	89
7.2. Suggestions for further research	90
A. Appendix	93
A.1. Bark scale	93
A.2. Analysis results of inflight recordings	94
A.3. Modal data of the numerical models	95
A.4. Convergence of genetic optimisation algorithm	9
A.5. Actuator placement optimisation results: diffuse field	9
A.6. Modal data of experimental models	1
A.7. Positions tested for the placements of the secondary actuator	10
A.8. Technical documentation of hardware	10
