Summary	v
Zusammenfassung	vii
Acknowledgment	ix
Structure of the thesis	xi
I Introduction	1
1 Motivation	3
2 Structure and mechanical properties of soft tissues	5
2.1 Structural properties of soft tissues	5
2.1.1 Collagen	
2.1.2 Elastin	
2.1.3 Ground substance and elongated shape cells	
2.1.4 Characterization of alignments of fibers	
2.2 Mechanical properties of soft tissues	10
2.2.1 Nonlinearity	
2.2.2 Anisotropy	
2.2.3 Incompressibility	
2.2.4 Viscoelasticity	
2.2.5 Active property	
2.2.6 Growth and remodeling	
2.3 The complexity of biomechanical simulations	14
3 Hyperelastic constitutive models	15
3.1 Basic principles of the material modeling	15
3.2 Material symmetry	16
3.2.1 Distinct fibers	
3.2.2 Continuously distributed fibers	
3.3 Functional basis	19
3.3.1 Functional basis of isotropic tensor functions	
3.3.2 Functional basis of anisotropic tensor functions	
3.4 Polyconvexity	21

3.5	Polyconvex strain energy functions	23
3.5.1	Additive polyconvex strain-energy function	
3.5.2	Coercivity condition	
3.5.3	Nearly incompressibility	
3.5.4	Energy- and stress-free constraints	
3.6	Specific polyconvex anisotropic constitutive models	25
II	Identification of preferred fiber orientations in soft tissues	29
4	Numerical methods for identifying anisotropic orientations	31
4.1	Introduction	31
4.1.1	Finite element mesh generation	
4.2	Heat-conduction based method	34
4.2.1	Geometrical treatments for complex anisotropic orientations distributions	
4.3	Sketch based smoothing method	35
4.3.1	User-drawn sketches and constraint vectors	
4.3.2	Laplace smoothing algorithm	
4.3.3	Example	
4.4	Concluding remarks	40
III	Finite element technology	43
5	A mixed finite element method with application to nearly incompressible materials	45
5.1	Introduction	45
5.2	Finite element formulation	46
5.2.1	Standard 10-node tetrahedral element	
5.2.2	A mixed finite element method based on polyconvex constitutive models	
5.3	Numerical results	54
5.4	Concluding remarks	57
IV	Biomechanical simulations	61
6	Algorithms for calculating an unloaded reference configuration of a patient-specific geometry	63
6.1	Introduction	63
6.2	Material and methods	65
6.2.1	Constitutive model	
6.2.2	Fiber reorientation	

6.2.3	An academic example	
6.3	Updated reference configuration associated with fiber reorientation	71
6.4	Updated reference configuration associated with fiber identification	74
6.5	Concluding remarks	76
7	Finite element analyses of patient-specific geometries	79
7.1	Assessment of prestressing patient-specific iliac artery aneurysm	79
7.1.1	Material and methods	
7.1.2	Validation analyses	
7.1.3	Discussion	
7.2	Quantification of stress inside human brain tissue in case of increased intracranial pressure	86
7.2.1	Material and methods	
7.2.2	Numerical results	
7.3	Quantification of female breast deformation with consideration of anisotropy of human skin	90
7.3.1	Material and methods	
7.3.2	Validation and analyses	
7.3.3	Discussion	
V	Conclusion	97
8	General conclusion	99
A	Fundamentals of continuum mechanics	101
A.1	Kinematics	101
A.2	Stress	104
A.3	Balance principles	105
A.4	Laws of thermodynamics	107
A.5	Balance of entropy	110
B	Fundamentals of finite element method	113
B.1	Nonlinearity	113
B.2	Boundary value problem	113
B.3	Weak formulation	114
B.4	Linearization	115
B.5	Finite element discretization	116
