ABSTRACT:

With the ongoing loss of global biodiversity, long-term recordings of species distribution patterns are increasingly becoming important to investigate the causes and consequences for their change. Therefore, the digitization of scientific literature, both modern and historical, has been attracting growing attention in recent years. To meet this growing demand the *Specialised Information Service for Biodiversity Research* (BIOfid) was launched in 2017 with the aim of increasing the availability and accessibility of biodiversity information. Closely tied to the research community the interdisciplinary BIOfid team is digitizing data sources of biodiversity related research and provides a modern and professional infrastructure for hosting and sharing them. As a pilot project, German publications on the distribution and ecology of vascular plants, birds, moths and butterflies covering the past 250 years are prioritized. Large parts of the text corpus defined in accordance with the needs of the relevant German research community have already been transferred to a machine-readable format and will be publicly accessible soon. Software tools for text mining, semantic annotation and analysis with respect to the current trends in machine learning are developed to maximize bioscientific data output through user-specific queries that can be created via the BIOfid web portal (<https://www.biofid.de/>). To boost knowledge discovery, specific ontologies focusing on morphological traits and taxonomy are being prepared and will continuously be extended to keep up with an ever-expanding volume of literature sources. Here we present the key elements of the BIOfid pipeline with emphasis on a practical approach to develop domain-specific ontologies, to deal with the dynamic nature of taxonomies, and to promote interoperability and standardization of terms and definitions. The taxonomic ontologies are designed to fetch any taxon-related literature entry. In this respect, scientific names, synonyms, vernaculars, taxonomic ranks and other classifications peculiar for the respective organism group are compiled. The sources to be used are common open access platforms like *Catalogue of Life* and the *Global Biodiversity Information Facility* (GBIF), complemented by databases more narrowly focusing on certain taxa, such as the *International Ornithological Congress* (IOC) *World Bird List*. We further give insight into our work on the OBO Foundry *Flora Phenotype Ontology* (FLOPO) and the *Lepidoptera Anatomy Ontology* (LepAO). The latter is build on the already existing *Hymenoptera Anatomy Ontology* (HAO) and developed within the framework of an international collaboration that aims at designing a unified *Insect Anatomy Ontology*. BIOfid is co-funded by the Deutsche Forschungsgemeinschaft (DFG) under project number 326061700.

Preface

It is with great pleasure to welcome you to the 10th International Conference on Ecological Informatics hosted by the Friedrich Schiller University, Jena, Germany.

The Conference Proceedings are an impressive display of the current scope of Ecological Informatics as schematically represented in Figure. 1.

Whilst Data Management, Analysis, Synthesis and Forecasting have been lasting popular themes over the past nine biannual ICEI conferences, ICEI 2018 addresses distinctively novel developments in Data Acquisition enabled by cutting edge *in situ* and remote sensing technology.

The here presented ICEI 2018 program captures well current trends and challenges of Ecological Informatics towards: • regional, continental and global sharing of ecological data, • thorough integration of complementing monitoring technologies including DNA-barcoding, • sophisticated pattern recognition by deep learning, • advanced exploration of valuable information in 'big data' by means of machine learning and process modelling, • decision-informing solutions for biodiversity conservation and sustainable ecosystem management in light of global changes.

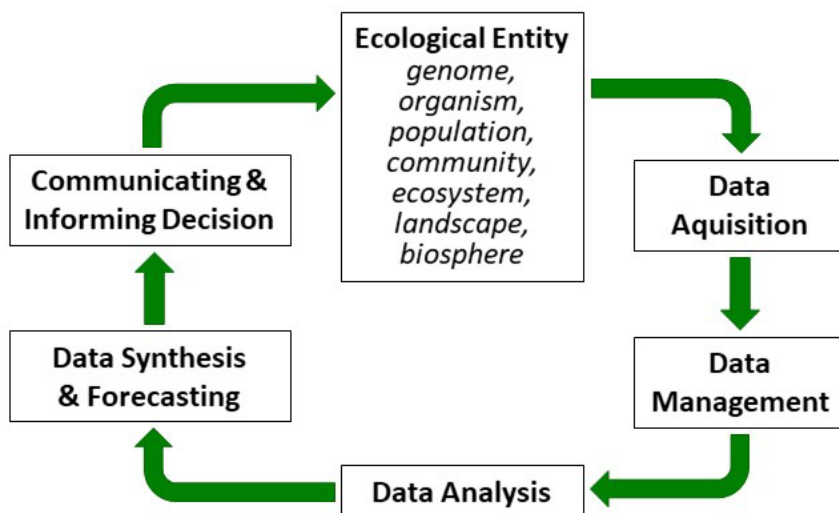

Figure. 1: Scope of Ecological Informatics

I herewith wish all delegates an inspiring week of science, communication and socialising.

Adelaide, 5th September 2018

Table of Content

Session R1.1	14
Ecological monitoring by camera, thermal and acoustic images.....	15
Keeping the Human in the Loop: Towards Automatic Visual Monitoring in Biodiversity Research	16
Automating biological monitoring on the Northern Andes of South America: combining biology and machine learning for conservation	17
Understanding the Relationship between Soundscape and Landscape Features in a Tropical Andean Environment.....	18
The Diversity of Heath Flowering Phenology– Revealing Fine Scale Patterns of Heterogeneity by High Resolution Drone Cameras	19
Using automated species identification in passive acoustic recording to test the acoustic niche partition hypothesis in Neotropical frogs	21
Automated recognition of people and identification of animal species in camera trap images.....	22
A method for automatic creation of a vegetation map using high-resolution aerial photographs of unmanned aerial vehicles	23
Complimenting long-term bird monitoring observations with acoustic sensors and camera traps: best of both worlds.....	24
Optimisation of video monitoring of fish for reef assessment and management.....	25
Annotating Species Trait Images with Absolute Size Information Using Mobile Devices	26
Session R2.1	27
Understanding Species Distribution, population Dynamics and Phenology by Machine Learning.....	28
Performance evaluation and hyperparameter tuning of statistical and machine-learning models using spatial data.....	29
Statistically reinforced machine learning for nonlinear interactions of factors and hierarchically nested spatial patterns.....	30
Reconstruction and Recognition of Spatial Patterns from Sparse Data in the Problem of Biological Invasion	31
Modeling Green Peach Aphid populations exposed to elicitors inducing plant resistance on peach	32
Testing the strengths of relationships between otter populations, fish and macroinvertebrate communities as well as habitat conditions across three Korean rivers by inferential modelling based on the hybrid evolutionary algorithm HEA	33
Community and Population Abundance Patterns in Benthic Macroinvertebrates in Streams Unravalled by Species Abundance Distribution and Machine Learning.....	34

Modelling urban bird breeding sites with a random forest classifier using indicators of spatial heterogeneity in plant communities derived from earth observation data..... 35

A machine learning approach to the assessment of the vulnerability of *Posidonia oceanica* meadows 36

Supervised learning methods to predict species interactions based on traits and phylogeny 37

Overall and site-specific response of the macroinvertebrate community of Swan Coastal Plain Wetlands (West Australia) to water quality gradients revealed by GF and HEA..... 38

Causal relationships of *Cylindrospermopsis* dynamics with water temperature and N/P-ratios: a meta-analysis across lakes with different climate based on inferential modelling by HEA 39

Remote Sensing based Estimation of Forest Biophysical Variables using Machine Learning Algorithm 40

A mixed model approach to modelling global habitat suitability and invasion risk of the American bullfrog... 41

Dynamics of Four Cyanobacteria in the Nakdong River, South Korea over 24 years (1993-2016) Patternized by an Artificial Neural Network 42

Integrating context-based recommendation with deep CNN image classification for on-site plant species identification 43

Session S1.1 44

Earth Observation for ecosystem analysis and decision making 45

Forest biodiversity estimated from the space: testing the Spectral Variation Hypothesis comparing Landsat 8 and Sentinel 2 using a multi-temporal Rao Q..... 46

Gross Primary Production and spring onset linked by spatio-temporal data analysis 47

Monitoring the spread of invasive plant species in Germany – how many species can we possibly detect by remote sensing and what data do we need?..... 48

Spatial Patterns of Leaf Mass per Area of Wetland Vegetation under Water Stress Analyzed with Imaging Spectroscopy 49

A constrained depth-resolved artificial neural network model of marine phytoplankton primary production .. 50

Exploring environmental variables based on ecotopes derived by remote sensing..... 51

Estimating Gross Primary Productivity in Crops with Satellite Data, Radiative Transfer Modeling and Machine Learning 52

Estimating Grassland Biomass - Potentials and Limitations of Point Cloud Analysis 53

Integration of near-surface and satellite observations for algal bloom detection 54

A neural network approach to infer the 3D chlorophyll-a field from remote sensing observations 55

Towards Understanding the Trends of Informal Harvesting of Sand Forest in Maputaland, South Africa 56

Challenges and opportunities of Earth observation for the prediction of water quality in inland waters 57

Mapping of invasive plant species with Sentinel-1 and -2 data calibrated with UAV-based training data 58

Interactive tool for real-time delivery of remote sensing based vegetation maps and support of botanical data collection 59

Modelling tree species diversities of the Afromontane forest ecosystem with satellite remote sensing and macro-ecological data 60

Connectivity and Synchronisation of Lake Ecosystems in Space and Time - CONNECT 61

Session S1.2 62

Analysis of ecoacoustic recordings: detection, segmentation and classification 63

AUREAS: a tool for recognition of anuran vocalizations 64

Content Description of Very-long-duration Recordings of the Environment 65

What male humpback whale song chorusing can and cannot tell us about their ecology: strengths and limitations of passive acoustic monitoring of a vocally active baleen whale 66

Improving acoustic monitoring of biodiversity using deep learning-based source separation algorithms 67

Acoustic sensor networks and machine learning: scalable ecological data to advance evidence-based conservation 68

Information retrieval from marine soundscape by using machine learning-based source separation 69

A Novel Set of Acoustic Features for the Categorization of Stridulatory Sounds in Beetles 70

Noise robust 2D bird localization via sound using microphone arrays 71

Fine-scale observations of spatiotemporal dynamics and vocalization type of birdsongs using microphone arrays and unsupervised feature mapping 72

Articulating citizen science, automatic classification and free web services for long-term acoustic monitoring: examples from bat monitoring schemes in France and UK 74

Extracting information on bat activities from long-term ultrasonic recordings through sound separation 75

Session S1.3 76

Computer vision in environmental sciences 77

NAIRA a tool to automatic mammals genera identification in Camera Trapping Pictures 78

Assessment of permanent grasslands in Latvia using spectral remote sensing techniques 79

Exploiting Taxonomic Relations in Image-based Plant Species Classification 80

Computer vision applications using multispectral UAS imagery: comparing pixel and object-based methods for automatic classification of river landscapes 81

Tracking swimming *Lefua echigonia* to assess the impact of crayfish introduction 82

Trends in machine learning for plant species identification	83
Deep Learning for Cracking the Leaf Code	84
Session S1.4.....	85
Integrating data for analysis – how far are we?.....	86
Whip: Human and machine-readable specifications for data	87
sPlot – the global vegetation-plot database	88
Integration and dissemination of aquatic biodiversity and ecosystem services data for case studies focusing on ecosystem-based management	90
