

Contents

- 1 Introduction to electrochemical carbon dioxide reduction — 1**
 - 1.1 The role of electrochemical CO₂ reduction in global decarbonisation — 1
 - 1.2 CO₂ reduction to value-added materials — 4
 - 1.2.1 Carbon monoxide and syngas — 5
 - 1.2.2 Formic acid — 6
 - 1.2.3 Methane and methanol — 8
 - 1.2.4 Ethylene and ethanol — 8
 - 1.2.5 Additional products — 9
 - 1.3 Primary challenges — 9
 - 1.3.1 Single product selectivity — 9
 - 1.3.2 Changes to the solution environment — 12
 - 1.3.3 Carbon costs — 14
 - 1.3.4 Financial costs — 17
 - 1.3.5 Stability to continued operations — 19
 - 1.3.6 Key targets — 21

- 2 Reaction mechanisms — 23**
 - 2.1 C₁ product route — 23
 - 2.1.1 Formate and formic acid — 24
 - 2.1.2 Carbon monoxide — 25
 - 2.1.3 Methane and methanol — 26
 - 2.2 C₂ product route — 29
 - 2.2.1 Ethylene and ethanol — 29
 - 2.2.2 C₃₊ and beyond — 32
 - 2.3 Computational activity predictors and scaling relationships — 33
 - 2.4 Hydrogen evolution reaction — 38

- 3 Catalyst design — 41**
 - 3.1 Carbon monoxide and syngas — 41
 - 3.2 Formate and formic acid — 45
 - 3.3 Copper catalysts — 49
 - 3.3.1 Methane and methanol — 51
 - 3.3.2 Ethylene and ethanol — 53
 - 3.3.3 Acetate and acetic acid — 58
 - 3.3.4 Propanol — 59
 - 3.4 Tandem catalysts — 61
 - 3.5 Non-copper catalysts for higher order products — 63

4 Electrolytes — 67

- 4.1 Aqueous electrolytes — 67
 - 4.1.1 pH — 67
 - 4.1.2 Anions — 70
 - 4.1.3 Cations — 72
- 4.2 Organic solvents — 74
 - 4.2.1 Aprotic solvents — 75
 - 4.2.2 Hydrated organic solvents — 78
 - 4.2.3 Protic organic solvents — 80
- 4.3 Ionic liquids — 81
 - 4.3.1 Cation effects — 81
 - 4.3.2 Protonation steps in ionic liquids — 85
 - 4.3.3 Cheaper catalyst materials — 86

5 Reactor engineering — 91

- 5.1 Electrode architectures — 91
 - 5.1.1 Foil and mesh electrodes — 91
 - 5.1.2 Nanostructured materials — 91
 - 5.1.3 Gas diffusion electrodes — 94
 - 5.1.4 Polymer coatings and additives — 99
- 5.2 Reactor designs — 102
 - 5.2.1 Divided and undivided reactors — 102
 - 5.2.2 Flow cells — 106
 - 5.2.3 Zero-gap cells — 109
 - 5.2.4 Microfluidic devices — 110
 - 5.2.5 Reactor pressure, CO₂ partial pressure and temperature — 112

6 Future perspectives — 117

- 6.1 High-priority research focus — 117
 - 6.1.1 Extended operations — 117
 - 6.1.2 Enhanced selectivity — 120
 - 6.1.3 Considering the anode — 122
- 6.2 Complimentary technologies — 124
 - 6.2.1 Green energy security — 124
 - 6.2.2 Multi-synthesis reactors — 125
 - 6.2.3 Broader considerations — 127
