A. Editorials

A.1 Preface

A.2 Contents

A.3 Conventions

B. General Linear Fluid Acoustics

B.1 Fundamental differential equations

B.2 Material constants of air

B.3 General relation for field admittance and intensity

B.4 Integral relations

B.5 Green’s functions and formalism

B.6 Orthogonality of modes in a duct with locally reacting walls

B.7 Orthogonality of modes in a duct with laterally reacting walls

B.8 Source conditions

B.9 Sommerfeld’s condition

B.10 Principles of superposition

B.11 Hamilton’s principle

B.12 Adjoined wave equation

B.13 Vector and tensor formulation of fundamentals

B.14 Boundary condition at a moving boundary

B.15 Boundary conditions at liquids and solids
Formulas of Acoustics VIII

Contents

B.16 Corner conditions ................................................................. 39
B.17 Surface wave at locally reacting plane ........................................... 39
B.18 Surface wave along a locally reacting cylinder ............................... 41
B.19 Periodic structures, admittance grid ............................................ 42
B.20 Plane wall with wide grooves ..................................................... 47
B.21 Thin grid on half-infinite porous layer ......................................... 49
B.22 Grid of finite thickness with narrow slits on half-infinite porous layer ... 52
B.23 Grid of finite thickness with wide slits on half-infinite porous layer ... 54

C. Equivalent Networks

C.1 Fundamentals of equivalent networks ............................................ 59
C.2 Distributed network elements ...................................................... 65
C.3 Elements with constrictions ....................................................... 70
C.4 Superposition of multiple sources in a network .............................. 71
C.5 Chain circuit ............................................................................. 71

D. Reflection of Sound

D.1 Plane wave reflection at a locally reacting plane ............................ 74
D.2 Plane wave reflection at an infinitely thick porous layer .................. 75
D.3 Plane wave reflection at a porous layer of finite thickness ............... 76
D.4 Plane wave reflection at a multiple layer absorber .......................... 78
D.5 Diffuse sound reflection at a locally reacting plane ......................... 79
D.6 Diffuse sound reflection at a bulk reacting porous layer .................. 81
D.7 Sound reflection and scattering at finite-size absorbers ................... 82
D.8 Uneven, local absorber surface ................................................... 86
D.9 Scattering at the border of an absorbent half-plane ........................ 88
D.10 Absorbent strip in a hard baffle wall, with far field distribution ............................................. 89

D.11 Absorbent strip in a hard baffle wall, as variational problem ...................................................... 91

D.12 Absorbent strip in a hard baffle wall, with Mathieu functions ..................................................... 94

D.13 Absorption of finite-size absorbers as a problem of radiation ..................................................... 98

D.14 A monopole line source above an infinite, plane absorber; integration method ..................................... 99

D.15 A monopole line source above an infinite, plane absorber; with principle of superposition ......................... 107

D.16 A monopole point source above a bulk reacting plane, exact forms ............................................... 109

D.17 A monopole point source above a locally reacting plane, exact forms ............................................. 112

D.18 A monopole point source above a locally reacting plane, exact saddle point integration ....................... 114

D.19 A monopole point source above a locally reacting plane, approximations ....................................... 117

D.20 A monopole point source above a bulk reacting plane, approximations ........................................... 124

E. Scattering of Sound

E.1 Plane wave scattering at cylinders ................................................................................................. 129

E.2 Plane wave scattering at cylinders and spheres ............................................................................. 132

E.3 Multiple scattering at cylinders and spheres .................................................................................. 142

E.4 Cylindrical wave scattering at cylinders ....................................................................................... 143

E.5 Cylindrical or plane wave scattering at a corner surrounded by a cylinder ........................................ 145

E.6 Plane wave scattering at a hard screen ............................................................................................ 152

E.7 Cylindrical or plane wave scattering at a screen with an elliptical cylinder atop ................................ 153

E.8 Uniform scattering at screens and dams ......................................................................................... 158

E.9 Scattering at a flat dam ................................................................................................................... 167

E.10 Scattering at a semicircular absorbing dam on absorbing ground .................................................... 169

E.11 Scattering in random media, general ............................................................................................. 173
E.12 Function tables for monotype scattering .................................................. 180
E.13 Sound attenuation in a forest ......................................................................... 184
E.14 Mixed monotype scattering in random media .................................................. 186
E.15 Multiple triple-type scattering in random media ................................................. 191
E.16 Plane wave scattering at elastic cylindrical shell ............................................. 202
E.17 Plane wave backscattering by a liquid sphere ................................................ 205
E.18 Spherical wave scattering at a perfectly absorbing wedge ................................. 206
E.19 Impulsive spherical wave scattering at a hard wedge ...................................... 208
E.20 Spherical wave scattering at a hard screen .................................................... 210

F. Radiation of Sound

F.1 Definition of radiation impedance and end corrections ........................................ 214
F.2 Some methods to evaluate the radiation impedance .......................................... 216
F.3 Spherical radiators .......................................................................................... 218
F.4 Cylindrical radiators ....................................................................................... 222
F.5 Piston radiator on a sphere ............................................................................. 224
F.6 Strip-shaped radiator on cylinder ..................................................................... 226
F.7 Plane piston radiators ..................................................................................... 227
F.8 Uniform end correction of plane piston radiators ............................................. 236
F.9 Narrow strip-shaped, field excited radiator ...................................................... 236
F.10 Wide strip-shaped, field excited radiator ....................................................... 238
F.11 Wide rectangular, field excited radiator ........................................................ 240
F.12 End corrections .............................................................................................. 243
F.13 Piston radiating into a hard tube .................................................................... 253
F.14 Oscillating mass of a fence in a hard tube .................................................... 253
F.15 A ring-shaped piston in a baffle wall ............................................................. 254
Contents

F.16 Measures of radiation directivity.............................................................. 255
F.17 Directivity of radiator arrays ................................................................. 256
F.18 Radiation of finite length cylinder ........................................................... 260
F.19 Monopole and multipole radiators.......................................................... 261
F.20 Plane radiator in a baffle wall ............................................................... 264
F.21 Ratio of radiation and excitation efficiencies of plates............................ 269
F.22 Radiation of plates with special excitations............................................ 269

G. Porous Absorbers

G.1 Structure parameters of porous materials ............................................. 272
G.2 Theory of the quasi-homogeneous material .......................................... 276
G.3 RAYLEIGH model with round capillaries ............................................. 277
G.4 Model with flat capillaries .................................................................... 280
G.5 Longitudinal flow resistivity in parallel fibres ...................................... 281
G.6 Longitudinal sound in parallel fibres ..................................................... 283
G.7 Transversal flow resistivity in parallel fibres ........................................ 286
G.8 Transversal sound in parallel fibres ....................................................... 293
G.9 Effective wave multiple scattering in transversal fibre bundle .............. 304
G.10 BIOT's theory of porous absorbers ....................................................... 309
G.11 Empirical relations for characteristic values of fibre absorbers .......... 319
G.12 Characteristic values from theoretical models fitted to experimental data 324

H. Compound Absorbers

H.1 Absorber of flat capillaries ..................................................................... 330
H.2 Plate with narrow slits .......................................................................... 333
H.3 Plate with wide slits ............................................................................. 336
I. Sound Transmission

I.1 “Noise barriers” .................................................. 431
I.2 Sound transmission through a slit in a wall ......................... 434
I.3 Sound transmission through a hole in a wall ......................... 439

J. Duct Acoustics

J.1 Flat capillary with isothermal boundaries ........................................... 527
J.2 Flat capillary with adiabatic boundaries ........................................... 530
J.3 Circular capillary with isothermal boundary ........................................ 531
J.4 Lined ducts, general ............................................................................. 534
J.5 Modes in rectangular ducts with locally reacting lining ......................... 538
J.6 Least attenuated mode in rectangular, locally lined ducts ....................... 541
J.7 Sets of mode solutions in rectangular, locally lined ducts ....................... 545
J.8 Flat duct with bulk reacting lining .................................................... 552
J.9 Flat duct with anisotropic, bulk reacting lining ...................................... 554
J.10 Mode solutions in a flat duct with bulk reacting lining ............................ 555
J.11 Flat duct with unsymmetrical, locally reacting lining ............................. 558
J.12 Flat duct with unsymmetrical, bulk reacting lining .............................. 560
J.13 Round duct with locally reacting lining ............................................. 561
J.14 Admittance of annular absorbers approximated with flat absorbers .......... 575
J.15 Round duct with bulk reacting lining ............................................. 577
J.16 Annular ducts .................................................................................... 580
J.17 Duct with cross-layered lining .......................................................... 583
J.18 Single step of duct height and/or duct lining ........................................ 591
J.19 Sections and cascades of silencers without feedback ............................. 602
J.20 A section with feedback between sections without feedback .................. 603
J.21 Concentrated absorber in an otherwise homogeneous lining .................. 607
J.22 Wide splitter type silencer with locally reacting splitters ....................... 611
J.23 Splitter type silencer with locally reacting splitters in a hard duct ............ 614
J.24 Splitter type silencer with simple porous layers as bulk reacting splitters 620
| J.25 | Splitter type silencer with splitters of porous layers covered with a foil | 623 |
| J.26 | Lined duct corners and junctions | 625 |
| J.27 | Sound radiation from lined duct orifice | 630 |
| J.28 | Conical duct transitions; special case: hard walls | 634 |
| J.29 | Lined conical duct transition, evaluated with stepping duct sections | 637 |
| J.30 | Lined conical duct transition, evaluated with stepping admittance sections | 644 |
| J.31 | Mode mixtures | 647 |
| J.32 | Mode excitation coefficients | 651 |
| J.33 | CREMER's admittance | 653 |
| J.34 | CREMER's admittance with parallel resonators | 658 |
| J.35 | Influence of flow on attenuation | 665 |
| J.36 | Influence of temperature on attenuation | 673 |
| J.37 | Stationary flow resistance of splitter silencers | 675 |
| J.38 | Nonlinearities by amplitude and/or flow | 675 |
| J.39 | Flow-induced nonlinearity of perforated sheets | 681 |
| J.40 | Reciprocity at duct joints | 683 |
| J.41 | Turning-vane splitter silencer | 683 |

| K.0 | Conventions in the present chapter | 689 |
| K.1 | Acoustic power in a flow duct | 690 |
| K.2 | Radiation from the open end of a flow duct | 691 |
| K.3 | Transfer matrix representation | 692 |
| K.4 | Muffler performance parameters | 693 |
| K.5 | Uniform tube with flow and viscous losses | 695 |
| K.6 | Sudden area changes | 696 |
Formulas of Acoustics

K.7 Extended inlet/outlet ................................................................. 698
K.8 Conical tube ................................................................. 700
K.9 Exponential horn ................................................................. 700
K.10 Hose ................................................................. 701
K.11 Two-duct perforated elements ........................................ 703
K.12 Three-duct perforated elements ........................................ 711
K.13 Three-duct perforated elements with extended perforations ........................................ 717
K.14 Three-pass (or four-duct) perforated elements ........................................ 722
K.15 Catalytic converter elements ........................................ 726
K.16 Helmholtz resonator ........................................ 728
K.17 In-line cavity ........................................ 728
K.18 Bellows ........................................ 729
K.19 Pod silencer ........................................ 730
K.20 Quincke tube ........................................ 731
K.21 Annular airgap lined duct ........................................ 732
K.22 Micro-perforated Helmholtz panel parallel baffle muffler ........................................ 734
K.23 Acoustically lined circular duct ........................................ 735
K.24 Parallel baffle muffler (Multi-pass lined duct) ........................................ 737

L. Capsules and Cabins

L.1 The energetic approximation for the efficiency of capsules ........................................ 741
L.2 Absorbent sound source in a capsule ........................................ 745
L.3 Semicylindrical source and capsule ........................................ 751
L.4 Hemispherical source and capsule ........................................ 755
L.5 Cabins, semicylindrical model ........................................ 760
L.6 Cabin with plane walls ........................................ 764
L.7 Cabin with rectangular cross section .............................................................................. 770

**M. Room Acoustics**

M.1 Eigenfunctions in parallelepipeds .................................................................................. 774
M.2 Density of eigenfrequencies in rooms .............................................................................. 777
M.3 Geometrical room acoustics in parallelepipeds ................................................................. 778
M.4 Statistical room acoustics .................................................................................................. 780
M.5 The mirror source model ................................................................................................... 784
M.6 Ray tracing models ............................................................................................................ 837
M.7 Room impulse responses, decay curves, and reverberation times ..................................... 841
M.8 Other room acoustical parameters .................................................................................... 842

**N. Flow Acoustics**

N.1 Concepts and notations in fluid mechanics, in connection with the field of aeroacoustics .................................................................................................................. 846
N.2 Some tools in fluid mechanics and aeroacoustics .............................................................. 850
N.3 The basic equations of fluid motion .................................................................................... 856
N.4 The equations of linear acoustics ....................................................................................... 863
N.5 The inhomogeneous wave equation, Lighthill's acoustic analogy ........................................ 866
N.6 Acoustic Analogy with source terms using the pressure ..................................................... 871
N.7 Acoustic analogy with mean flow effects, in form of convective inhomogeneous wave equation .................................................................................................................. 874
N.8 Acoustic analogy in terms of vorticity, wave operators for enthalpy .................................. 880
N.9 Acoustic analogy with effects of solid boundaries ............................................................. 890
N.10 Acoustic analogy in terms of entropy, heat sources as sound sources, sound generation by turbulent two-phase flow ................................................................. 895
N.11 Acoustics of moving sources ............................................................................................. 901
O. Analytical and Numerical Methods in Acoustics

O.1 Computational optimisation of sound absorbers ............................................................................ 930
O.2 Computing with mixed numeric-symbolic expressions, illustrated with silencer cascades ................. 942
O.3 Five standard problems of numerical acoustics .............................................................................. 948
O.4 The source simulation technique .................................................................................................. 954
O.5 The boundary element method (BEM) ......................................................................................... 972
O.6 The finite element method (FEM) .................................................................................................. 989
O.7 The Cat's Eye model .................................................................................................................... 997
O.8 The Orange model ....................................................................................................................... 1005

P. Variational Principles in Acoustics

P.1 Eigenfrequencies of a rigid-walled cavity and modal cut-on frequencies of a uniform flat-oval duct with zero mean fluid flow ........................................................................ 1026
P.2 Sound propagation in a uniform narrow tube of arbitrary cross-section with zero mean fluid flow .................................................................................................................. 1029
P.3 Sound propagation in a uniform, rigid-walled, duct of arbitrary cross-section with a bulk-reacting lining and no mean fluid flow: low frequency approximation ........................................................................................................ 1034
P.4 Sound propagation in a uniform, rigid-walled, rectangular flow duct containing an anisotropic bulk-reacting wall lining or baffles ......................................................................................... 1035
P.5 Sound propagation in a uniform, rigid-walled, flow duct of arbitrary cross-section, with an inhomogeneous, anisotropic bulk lining ........................................................................................................ 1038
P.6 Sound propagation in a uniform duct of arbitrary cross-section with one or more plane flexible walls, an isotropic bulk lining and a uniform mean gas flow ........................................................................ 1042
P.7 Sound propagation in a rectangular section duct with four flexible walls, an anisotropic bulk lining and no mean gas flow ........................................................................................................ 1046
Q. Elasto-Acoustics

Q.1 Fundamental equations of motion ......................................................... 1052
Q.2 Anisotropy and isotropy ........................................................................ 1054
Q.3 Interface conditions, reflection and refraction of plane waves .......... 1059
Q.4 Material damping ................................................................................ 1060
Q.5 Energy .................................................................................................. 1064
Q.6 Random media ....................................................................................... 1066
Q.7 Periodic media ....................................................................................... 1067
Q.8 Homogenization ..................................................................................... 1070
Q.9 Plane waves in unbounded homogeneous media ............................... 1073
Q.10 Waves in bounded media .................................................................... 1077
Q.11 Moduli of isotropic materials and related quantities ...................... 1089
Q.12 Modes of rectangular plates ............................................................... 1093
Q.13 Partition impedance of plates ............................................................ 1096
Q.14 Partition impedance of shells .............................................................. 1099
Q.15 Density of eigenfrequencies in plates, bars, strings, membranes .... 1102
Q.16 Foot point impedances of forces ......................................................... 1102
Q.17 Transmission loss at steps, joints, corners ....................................... 1108
Q.18 Cylindrical shell .................................................................................. 1110
Q.19 Similarity relations for spherical shells ............................................ 1114
Q.20 Sound radiation from plates ............................................................... 1115

R. Ultrasound Absorption in Solids

R.1 Generation of ultrasound .................................................................... 1123
R.2 Ultrasonic attenuation ........................................................................... 1124
| R.3  | Absorption and dispersion in solids due to dislocations                       | 1129 |
| R.4  | Absorption due to the thermoelastic effects, phonon scattering and related effects | 1132 |
| R.5  | Interaction of ultrasound with electrons in metals                           | 1134 |
| R.6  | Wave propagation in piezoelectric semiconducting solids                     | 1136 |
| R.7  | Absorption in amorphous solids and glasses                                  | 1136 |
| R.8  | Relation of ultrasonic absorption to internal friction                      | 1138 |
| R.9  | Gases and liquids                                                           | 1138 |
| R.10 | Kramers-Kroning relation                                                    | 1138 |

**S. Nonlinear Acoustics**

| S.1  | General formulas                                                            | 1142 |
| S.2  | Riemann waves                                                               | 1144 |
| S.3  | Plane nonlinear waves in a dissipative medium                                | 1145 |
| S.4  | One-dimensional nonlinear waves in a dissipative medium                     | 1150 |
